

# MGT 2251 Management Science

## Exam 2

Professor Chang

October 9, 2012

Your Name (Print): \_\_\_\_\_

IDN: \_\_\_\_\_

Read each question carefully before you answer. Work at a steady pace, and you should have ample time to finish. Answer the multiple choice questions on the Scantron form. Good Luck!!!

My signature certifies that I have taken this exam in accordance with the Georgia Tech honor Code.

Signature \_\_\_\_\_

## I. Multiple Choice Questions

Choose the best answer for the following questions. (3 points each)

c \_\_\_\_ 1. When you use [www.MAPQUEST.com](http://www.MAPQUEST.com) to search the direction from a place to another place, the underneath model to solve the problem is

- a. transportation model
- b. minimal spanning tree model
- c. shortest path/route model
- d. assignment model

b \_\_\_\_ 2. A telecommunication company tries to install a system of cables to connect all possible customers with the goal of minimizing the total usage of cables. The appropriate network model to build the possible connection system would most likely be:

- a. transportation model
- b. minimal spanning tree model
- c. shortest path/route model
- d. maximal flow model

### Use the following data to answer questions 3-10

The Tru-Rainbow Company produces a variety of paint products for both commercial and private use. The demand for paint is highly seasonal, peaking in the third quarter. Current inventory is 350,000 gallons, and the annual ending inventory should be 400,000 gallons.

Tru-Rainbow's manufacturing manager wants to determine the best production plan using the following demand requirements and capacity plans. Demands and capacities below are expressed in thousands of gallons. The manager knows that the regular-time cost is \$1.00 per gallon, overtime cost is \$1.50 per gallon, subcontracting cost is \$1.90 per gallon, and inventory holding cost is \$0.30 per gallon per quarter.

|                | Quarter |     |       |     |       |
|----------------|---------|-----|-------|-----|-------|
|                | 1       | 2   | 3     | 4   | Total |
| Demand         | 500     | 850 | 1,500 | 350 | 3,200 |
| Capacities:    |         |     |       |     |       |
| Regular time   | 450     | 450 | 750   | 450 | 2100  |
| Overtime       | 150     | 150 | 150   | 90  | 540   |
| Subcontracting | 200     | 200 | 200   | 200 | 800   |
| Total          | 740     | 740 | 1,100 | 740 | 3,440 |

Demand can be satisfied by regular time production, overtime production, subcontracting, or inventory held from the previous quarter. The excess production will be held in inventory for future periods. No backorders or stock-outs are permitted.

a \_\_\_\_ 3. Let's assume that  $X_{ij}$  ( $i=r_1, r_2, r_3, r_4, o_1, o_2, o_3, o_4, s_1, s_2, s_3, s_4$ ;  $j=q_1, q_2, q_3, q_4$ ) is the production and shipping from supply node  $i$  to demand node  $j$ . What is the appropriate constraint for the regular production of quarter 2?

- a.  $Xr2q2 + Xr2q3 + Xr2q4 \leq 450000$
- b.  $Xr3q2 + Xr2q3 + Xr3q4 \leq 450000$
- c.  $Xr3q1 + Xr3q2 + Xr3q3 + Xr3q4 \geq 450000$
- d.  $Xr1q1 + Xr2q2 + Xr3q3 + Xr4q4 = 450000$

d \_\_\_\_ 4. Following the last question, let's assume that  $X_{ij}$  ( $i=r1, r2, r3, r4, o1, o2, o3, o4, s1, s2, s3, s4; j=q1, q2, q3, q4$ ) is the production and shipping from supply node  $i$  to demand node  $j$ . What is the appropriate constraint for the demand of quarter 4 (note that the quarter 4 demand needs to include ending inventory)?

- a.  $Xr1q4 + Xr2q4 + Xr3q4 + Xr4q4 + Xo1q4 + Xo2q4 + Xo3q4 + Xo4q4 + Xs1q4 + Xs2q4 + Xs3q4 + Xs4q4 = 350000$
- b.  $Xr1q4 + Xr2q4 + Xo1q4 + Xo4q4 + Xs1q4 + Xs4q4 \leq 750000$
- c.  $Xr1q4 + Xr2q4 + Xr3q4 + Xr4q4 + Xo1q4 + Xo2q4 = 850000$
- d.  $Xr1q4 + Xr2q4 + Xr3q4 + Xr4q4 + Xo1q4 + Xo2q4 + Xo3q4 + Xo4q4 + Xs1q4 + Xs2q4 + Xs3q4 + Xs4q4 = 750000$

Assume that the problem has been formulated as a transportation problem and solved by the Excel Solver. The following tables show the printouts from Excel reports including input, optimal solution output, and sensitivity analysis (partial).

d \_\_\_\_ 5. Based on the optimal solution, what is the total overtime production for all four quarters?

- a. 3,440,000
- b. 750,000
- c. 610,000
- d. 540,000

c \_\_\_\_ 6. Based on the optimal solution, what is the percentage of total production by subcontracting?

- a. 64.6%
- b. 16.6%
- c. 18.8%
- d. 24.5%

b \_\_\_\_ 7. Based on the following reports, if the demand in quarter 1 increases by 10,000 gallons, how much will the total cost change for the optimal solution?

- a. reduce by \$19,000
- b. increase by \$19,000
- c. reduce by \$22,000
- d. increase by \$9,000

d \_\_\_\_ 8. If you have an option to increase the regular time capacity by 5000 gallons in any of the four quarters. Which quarter will be the best choice from the reducing cost point of view?

- a. quarter 1
- b. quarter 2

- c. quarter 3
- d. quarter 4

a \_\_\_\_ 9. If you have an option to increase the regular time capacity by 10000 gallons in quarter 3, how much is the maximum cost you are willing to pay for this capacity increase?

- a. \$15,000
- b. \$12,000
- c. \$1,000
- d. \$6,000

c \_\_\_\_ 10. Now assume that the backorders are allowed and the backorder cost is \$0.50 per gallon per quarter. That means Tru-Rainbow can produce in later quarters to satisfy earlier quarter demand. For example, it can produce by using regular time capacity in quarter 3 to satisfy the demand in quarter 1. What is the unit cost you should enter in the INPUT table for producing by using regular time capacity in quarter 3 to satisfy the demand in quarter 1? (It is 1000000, a big cost, when backorder is not allowed.)

- a. \$1.5
- b. \$2.5
- c. \$2.0
- d. \$0.5

| INPUT    |          | Demand               |         | 150000  | 850000 | 1500000 | 750000 |

b \_\_\_\_ 11. In a job shop operation, four jobs: A12, A15, B2, and B9, need to be performed on any of the four machines: W, X, Y, and Z. The hours required for each job on each machine are presented in the following input table. The plant supervisor has arbitrarily made the following assignments: A12-W, A15-X, B2-Y, and B9-Z. However, you disagreed and used the assignment model to solve the optimal solution by Excel Solver shown below (Solution INPUT/OUTPUT). How much improvement has your optimal solution over the plant supervisor assignment?

- 10 hours
- 4 hours
- 2 hours
- 23 hours

| INPUT    |           |                 |    |    |    |

b \_\_\_\_ 12. A recent tragic fire in Carbonville, Illinois, has prompted the City Council to draft a new ordinance requiring all building to have fully operational sprinkler systems installed by the end of the year. The Talcon Building is affected by the ordinance. From the original blueprints, engineers have designed positions for the location of eight powerful sprinkler heads that are to be connected to the sprinkler controller (node 1). The feasible connections between these eight sprinkler heads and the controller with distance shown in feet are depicted in the following figure. What is the minimum amount of pipe required to connect all sprinkler heads and controller? (Note that the sprinkler head does not need to connect to the controller directly. It can connect to other head that is connected directly or indirectly to the controller.)

- a. 459 feet
- b. 603 feet
- c. 605 feet
- d. 711 feet

Use the following data to answer questions 13-18.

Jake Nguyen runs a nervous hand through his once finely combed hair. He loosens his once perfectly knotted silk tie. And he rubs his sweaty hands across his once immaculately pressed trousers. Today has certainly not been a good day.

Over the past few months, Jake had heard whispers circulating from Wall Street—whispers from the lips of investment bankers and stockbrokers famous for their outspokenness. They had whispered about a coming Japanese economic collapse—whispered because they had believed that publicly vocalizing their fears would hasten the collapse.

And, today, their very fears have come true. Jake and his colleagues gather around a small television dedicated exclusively to the Bloomberg channel. Jake stares in disbelief as he listens to the horrors taking place in the Japanese market. And the Japanese market is taking the financial markets in all other East Asian countries with it

on its tailspin. He goes numb. As manager of Asian foreign investment for Grant Hill Associates, a small West Coast investment boutique specializing in currency trading, Jake bears personal responsibility for any negative impacts of the collapse. And Grant Hill Associates will experience negative impacts.

Jake had not heeded the whispered warnings of a Japanese collapse. Instead, he had greatly increased the stake Grant Hill Associates held in the Japanese market. Because the Japanese market had performed better than expected over the past year, Jake had increased investments in Japan from \$2.5 million to \$25 million only one month ago. At that time, one dollar was worth 80 yen.

No longer, Jake realizes that today's devaluation of the yen means that one-dollar is worth 125 yen. He will be able to liquidate these investments without any loss in yen, but now the dollar loss when converting back into U.S. currency would be huge. He takes a deep breath, closes his eyes, and mentally prepares himself for serious damage control.

Jake's meditation is interrupted by a booming voice calling for him from a large, corner office. Grant Hill, the president of Grant Hill Associates, yells, "Nguyen, get the hell in here!"

Jake jumps and looks reluctantly toward the corner office hiding the furious Grant Hill. He smoothens his hair, tightens his tie, and walks briskly into the office.

Grant Hill meets Jake's eyes upon his entrance and continues yelling, "I don't want one word out of you, Nguyen! No excuses; just fix this debacle! Get all of our money out of Japan! My gut tells me this is only the beginning! Get the money into safe U.S. bonds! Now! And don't forget to get our cash positions out of Indonesia and Malaysia ASAP with it!"

Jake has enough common sense to say nothing. He nods his head, turns on his heels, and practically runs out of the office.

Safely back at his desk, Jake begins formulating a plan to move the investment out of Japan, Indonesia, and Malaysia. His experiences investing in foreign markets have taught him that when playing with millions of dollars, how he gets money out of a foreign market is almost as important as when he gets money out of the market. The banking partners of Grant Hill Associates charge different transaction fees for converting one currency into another one and wiring large sums of money around the globe.

And now, to make matters worse, the governments in East Asia have imposed very tight limits on the amount of money an individual or a company can exchange from the domestic currency into a particular foreign currency and withdraw it from the country. The goal of this dramatic measure is to reduce the outflow of foreign investments out of those countries to prevent a complete collapse of the economies in the region. Because of Grant Hill Associates' cash holdings of 15 billion Indonesia rupiahs and 40 million Malaysia ringgits, along with the holding in yen it is not clear how these holdings should be converted back into dollars.

Jake wants to find the most cost-effective method to convert these holdings into dollars. On his company's Web site, he always can find on-the-minute exchange rates for most currencies in the world (see Table 1).

| TABLE 1                      Currency Exchange Rates |     |        |         |             |                 |      |       |      |
|--|-----|--------|---------|-------------|-----------------|------|-------|------|
| From/To  | Yen | Rupiah | Ringgit | U.S. Dollar | Canadian Dollar | Euro | Pound | Peso |

|                   |   |    |        |         |        |          |          |          |
|-------------------|---|----|--------|---------|--------|----------|----------|----------|
| Japanese yen      | 1 | 50 | 0.04   | 0.008   | 0.01   | 0.0064   | 0.0048   | 0.0768   |
| Indonesia rupiah  |   | 1  | 0.0008 | 0.00016 | 0.0002 | 0.000128 | 0.000096 | 0.001536 |
| Malaysian ringgit |   |    | 1      | 0.2     | 0.25   | 0.16     | 0.12     | 1.92     |
| U.S. dollar       |   |    |        | 1       | 1.25   | 0.8      | 0.6      | 9.6      |
| Canadian dollar   |   |    |        |         | 1      | 0.64     | 0.48     | 7.68     |
| European euro     |   |    |        |         |        | 1        | 0.75     | 12       |
| English pound     |   |    |        |         |        |          | 1        | 16       |
| Mexican peso      |   |    |        |         |        |          |          | 1        |

The table states that, for example, 1 Japanese yen equals 0.008 U.S. dollar. By making a few phone calls, he discovers the transaction costs his company must pay for large currency transactions during these critical times (see Table 2).

| TABLE 2 Transaction Cost (Percent) |     |        |         |             |                 |      |       |      |

Jake notes that exchanging one currency for another one results in the same transaction cost as a reverse conversion. Finally, Jake finds out the maximum amounts of domestic currencies his company is allowed to convert into other currencies in Japan, Indonesia, and Malaysia (see Table 3).

| TABLE 3 Transaction Limits in Equivalent of 1,000 Dollars |       |        |         |             |                 |       |       |       |
|---|-------|--------|---------|-------------|-----------------|-------|-------|-------|
| From/To   | Yen   | Rupiah | Ringgit | U.S. Dollar | Canadian Dollar | Euro  | Pound | Peso  |

d \_\_\_\_ 13. As shown in the table above from the template, what network model was used to formulate the problem for Jake?

- transportation model
- minimal spanning tree model
- shortest path/route model
- transshipment model

b \_\_\_\_ 14. Let's assume that  $X_{ij}$ ,  $i$  and  $j$  are the node numbers defined in the Excel INPUT table, is the shipping quantity (amount of money converted) from node  $i$  to node  $j$ .

What is the appropriate constraint for the Euro currency node?

- $X_{14}+X_{24}+X_{34}+X_{54}+X_{64}+X_{74}+X_{84}=X_{41}+X_{42}+X_{43}+X_{45}+X_{46}+X_{47}+X_{48}$
- $X_{15}+X_{25}+X_{35}+X_{45}+X_{65}+X_{75}+X_{85}=X_{51}+X_{52}+X_{53}+X_{54}+X_{56}+X_{57}+X_{58}$
- $X_{16}+X_{26}+X_{36}+X_{46}+X_{56}+X_{76}+X_{86}=X_{61}+X_{62}+X_{63}+X_{64}+X_{65}+X_{67}+X_{68}$
- $X_{15}+X_{25}+X_{35}=X_{51}+X_{52}+X_{53}$

c \_\_\_\_ 15. Based on the Excel solution how much the Rupiah is directly exchanged to Euro in US dollar?

- 7,900,000
- 2,000,000
- 400,000
- 3,500,000

a \_\_\_\_ 16. Based on the Excel solution, how much all currencies are transferred into Pound in US dollar?

- 6,000,000
- 500,000
- 2,000,000
- 7,900,000

b \_\_\_\_ 17. By using the sensitivity analysis information, if there is \$1,000,000 value of more Yen needs to be transferred, what will the extra cost be?

- \$3,000
- \$5,000
- \$4,000

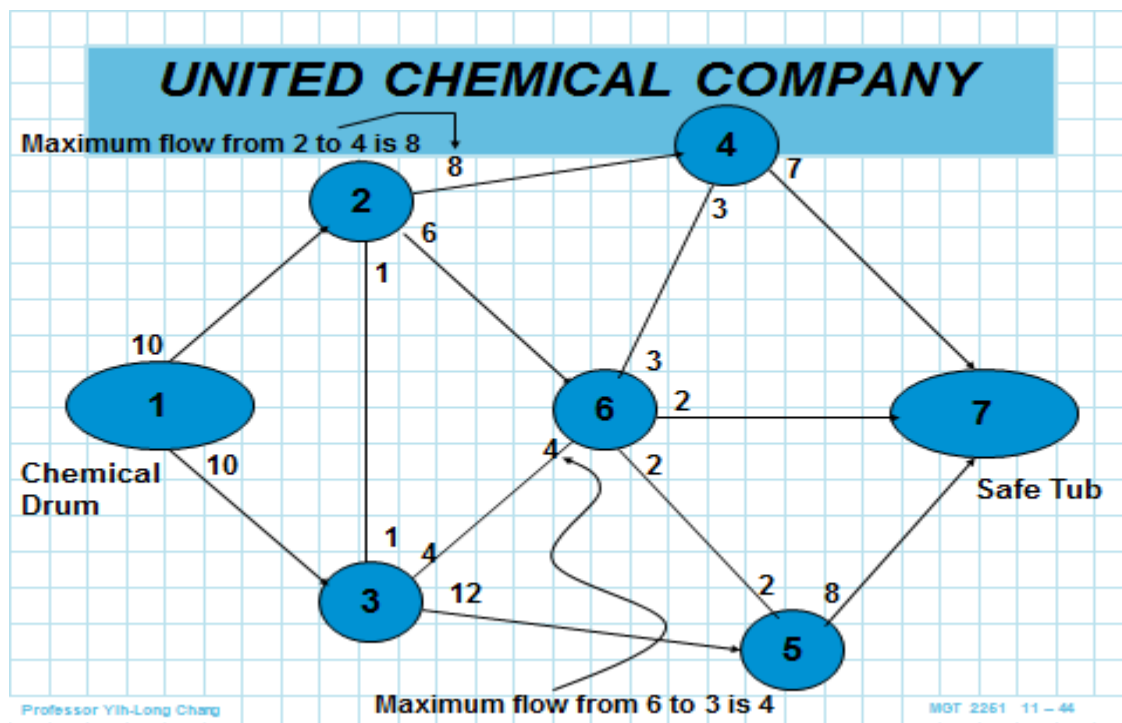

d. \$20,000

a \_\_\_\_ 18. After the money is transferred to US dollar, the transaction fee will be paid from the final pool and the balance will be used to purchase US Treasury Bond. Based on the optimal solution, how much US Treasury Bond will be purchased?

- a. 26,279,400
- b. 16,796,620
- c. 26,400,000
- d. 18,400,000

Use the following data to answer questions 19-20

United Chemical produces pesticides and lawn care products. Poisonous chemicals needed for the production process are held in a huge drum. A network of pipes and valves regulates the chemical flow from the drum to different production areas. The safety division must plan a procedure to empty the drum as fast as possible into a safety tub in the disposal area, using a network of pipes and valves. The following network shows the possible pipe connections (arcs) and valve locations (nodes). The number on arc represents the maximum flow capacity in thousand gallons per minute. For example, maximum flow from node 2 to node 4 is 8 thousand gallons per minute.

The problem is modeled as a maximal flow problem and solved by Excel Solver. The following table shows the optimal solution.

| NODE INPUT |               |        | ARC INPUT |    |          | SOLUTION | MAXIMUM FLOW= 17 |      |
|------------|---------------|--------|-----------|----|----------|----------|------------------|------|
|            | NODE NAME     | NODE # | FROM      | TO | CAPACITY | FROM     | TO               | FLOW |
| SOURCE     | Chemical Drum | 1      | 1         | 2  | 10       | 1        | 2                | 9    |

|            |               |        | 5         | 6  | 2        | 5        | 6                |      |
|            |               |        | 5         | 7  | 8        | 5        | 7                | 8    |
|            |               |        | 6         | 3  | 4        | 6        | 3                |      |
|            |               |        | 6         | 5  | 2        | 6        | 5                |      |
|            |               |        | 6         | 7  | 2        | 6        | 7                | 2    |

a \_\_\_\_ 19. Based on the optimal solution from Solver, how much does the chemical flow through (in and out) area/valve 6?

- 2 thousand gallons per minute
- 9 thousand gallons per minute
- 8 thousand gallons per minute
- 7 thousand gallons per minute

b \_\_\_\_ 20. If the chemical drum has 200 thousand gallons in deposit, what is the shortest time to discharge into safe tub?

- 15.11 minutes
- 11.76 minutes
- 10.00 minutes
- 5.88 minutes

## II. Problems.

1. Consider a capital budgeting problem in which five possible projects are being considered for implementation over the next three years. The expected returns for each project, the annual expenditures, and budgets (all in thousands of dollars) are shown in the table. Assume that each approved project will continue over the entire three-year period.

| Project | Expenditures |        |        | Expected Return |
|---------|--------------|--------|--------|-----------------|
|         | Year 1       | Year 2 | Year 3 |                 |
| 1       | 5            | 1      | 8      | 27              |
| 2       | 4            | 7      | 10     | 40              |
| 3       | 3            | 9      | 2      | 25              |

|        |    |    |    |    |
|--------|----|----|----|----|
| 4      | 7  | 4  | 7  | 19 |
| 5      | 8  | 6  | 10 | 28 |
| Budget | 25 | 30 | 32 |    |

(a). Formulate an integer linear programming model (including decision variables, objective function, and constraints) to maximize the total expected returns. Assume that unused funds for each year cannot be carried forward. (10 points)

DV (decision variables): (2 points)

Let  $X_i$ : 1 if project  $i$  is selected; 0 otherwise.

OBJ (objective function): (2 points)

Max  $27X_1 + 40X_2 + 25X_3 + 19X_4 + 28X_5$

Constraints: (6 points)

S.T.  $5X_1 + 4X_2 + 3X_3 + 7X_4 + 8X_5 \leq 25$   
 $8X_1 + 7X_2 + 9X_3 + 4X_4 + 6X_5 \leq 30$   
 $8X_1 + 10X_2 + 2X_3 + 7X_4 + 10X_5 \leq 32$   
For any  $X_i = 0, 1$

(b). When project 5 is selected, project 1 must be selected. Add this constraint. (2 points)

Add constraint:  $X_1 \geq X_5$  or  $X_1 - X_5 \geq 0$  or  $X_5 - X_1 \leq 0$

(c). No more than 4 projects should be selected. Add this constraint. (2 points)

Add constraint:  $X_1 + X_2 + X_3 + X_4 + X_5 \leq 4$

2. This problem is based on the following case problem: **Andrew-Carter, Inc.**

Andrew-Carter, Inc. (A-C), is a major Canadian producer and distributor of outdoor lighting fixture. Its fixture is distributed throughout North America and has been in high demand for several years. The company operates three plants that manufacture the fixture and distribute it to five distribution centers (warehouses).

During the present recession, A-C has seen a major drop in demand for its fixture as the housing market has declined. Based on the forecast of interest rates, the head of operations feels that demand for housing and thus for its product will remain depressed for the foreseeable future. A-C is considering closing one of its plants, as it is now operating with a forecasted excess capacity of 34,000 units per week. The forecasted weekly demands for the coming year are

|             |              |
|-------------|--------------|
| Warehouse 1 | 9,000 units  |
| Warehouse 2 | 13,000 units |
| Warehouse 3 | 11,000 units |
| Warehouse 4 | 15,000 units |
| Warehouse 5 | 8,000 units  |

The plant capacities in units per week are

|                       |              |
|-----------------------|--------------|
| Plant 1, regular time | 27,000 units |
| Plant 1, on overtime  | 7,000 units  |
| Plant 2, regular time | 20,000 units |
| Plant 2, on overtime  | 5,000 units  |
| Plant 3, regular time | 25,000 units |
| Plant 3, on overtime  | 6,000 units  |

If A-C shuts down any plants, its weekly costs will change, as fixed costs are lower for a nonoperation plant. Table 1 shows production costs at each plant, both variable at regular time and overtime, and fixed when operating and shut down. Table 2 shows distribution costs from each plant to each warehouse (distribution center).

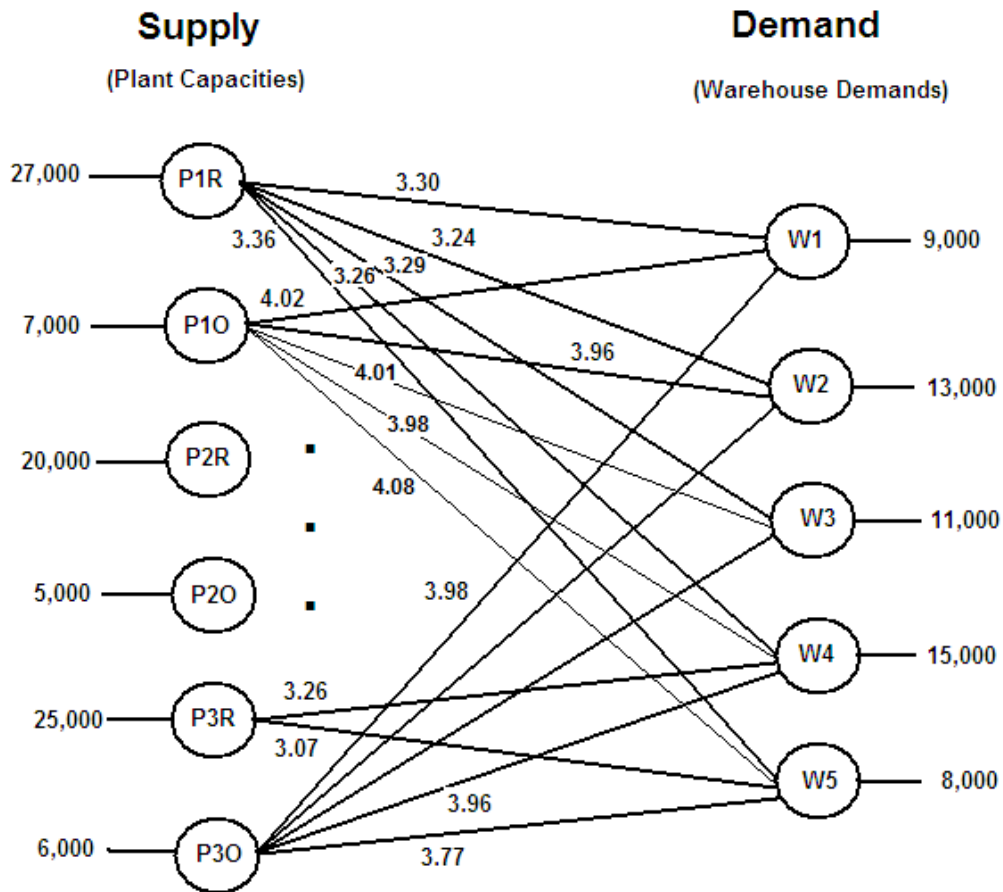

Table 1 Andrew-Carter, Inc., Variable Costs and Fixed Production Costs per week

| PLANT               | VARIABLE COST | FIXED COST PER WEEK |               |
|---------------------|---------------|---------------------|---------------|
|                     |               | OPERATING           | NOT OPERATING |
| No. 1, regular time | \$2.80/units  | \$14,000            | \$6,000       |
| No. 1, overtime     | 3.52          |                     |               |
| No. 2, regular time | 2.78          | 12,000              | 5,000         |
| No. 2, overtime     | 3.48          |                     |               |
| No. 3, regular time | 2.72          | 15,000              | 7,500         |
| No. 3, overtime     | 3.42          |                     |               |

Table 2 Andrew-Carter, Inc., Distribution Costs per Unit

| FROM PLANT | TO DISTRIBUTION CENTER |        |        |        |        |
|------------|------------------------|--------|--------|--------|--------|
|            | W1                     | W2     | W3     | W4     | W5     |
| No. 1      | \$0.50                 | \$0.44 | \$0.49 | \$0.46 | \$0.56 |
| No. 2      | 0.40                   | 0.52   | 0.50   | 0.56   | 0.57   |
| No. 3      | 0.56                   | 0.53   | 0.51   | 0.54   | 0.35   |

(a). Assume that no plant will be closed. Draw the transportation network diagram including all supply and demand nodes and all the possible connections (i.e., allocations) for AC's weekly production plan. Also include all supply and demand quantities and the unit transportation (i.e., allocation or variable) costs of plant 1 to all distribution centers (including regular and overtime productions). (10 points)

(b). If the optimal solution from Solver has the total cost \$179,730 for the production allocation, i. e., the total variable cost, what is the overall cost including variable and fixed costs for no plants are closed? (2 points)

Overall cost = 179730+14000+12000+15000=\$220,730.

3. This problem is based on the following case problem: Puyallup Mall (PM)

Jane Rodney, president of the Rodney Development Company, was trying to decide what types of stores to include in her new shopping center at Puyallup Mall. She had already contracted for a supermarket, a drugstore, and a few other stores that she considered essential. However, she had available an additional 18,000 square feet of floor space yet to allocate. She drew up a list of the 15 types of stores she might consider (see Table 1) including the floor space required by each. Jane did not think she would have any trouble finding occupants for any type of store.

The lease agreements Jane used in her developments included two types of payment. The store had to pay a certain annual rent, depending on the size and type of store. In addition, Jane was to receive a small percentage of the store's sales if the sales exceeded a specified minimum amount. The amount of annual rent from each store is shown in the second column of the table. To estimate the profitability of each type of

store, Jane calculated the present value of all future rent and sales percentage payments. These are given in the third column. Jane wants to achieve the highest total *present value* over the set of stores she selects. However, she could not simply pick those stores with the highest present values, for there were several restrictions. The first, of course, was that she has available only 18,000 square feet.

In addition, a condition on the financing of the project required that the total annual rent should be at least as much as the annual fixed costs (taxes, management fees, debt service, and so forth). These annual costs were \$150,000 for this part of the project. Finally, the total funds available for construction of this part of the project were \$800,000, and each type of store required different construction costs depending on the size and type of store (fourth column in the table).

In addition, Jane had certain requirements in terms of the mix of stores that she considered best. She wanted at least one store from each of the clothing, hard goods, and miscellaneous groups, and at least two from the restaurant category. She wanted no more than two from the clothing group. Furthermore, the number of stores in the miscellaneous group should not exceed the total number of stores in the clothing and hard goods groups combined.

**TABLE 1** Characteristics of Possible Leases for Puyallup Mall Shopping Center

| TYPE OF STORE               | SIZE OF STORE<br>(1,000s of Sq. Ft.) | ANNUAL<br>RENT (\$1,000s) | PRESENT<br>VALUE<br>(\$1,000s) | CONSTRUCTION<br>COST<br>(\$1,000s) |
|-----------------------------|--------------------------------------|---------------------------|--------------------------------|------------------------------------|
| <b>Clothing</b>             |                                      |                           |                                |                                    |
| 1. Men's                    | 1.0                                  | \$4.4                     | \$38.1                         | \$24.6                             |
| 2. Women's                  | 1.6                                  | 6.1                       | 44.6                           | 32.0                               |
| 3. Variety (both)           | 2.0                                  | 8.3                       | 60.0                           | 41.4                               |
| <b>Restaurants</b>          |                                      |                           |                                |                                    |
| 4. Fancy restaurant         | 3.2                                  | 24.0                      | 162.0                          | 124.4                              |
| 5. Lunchroom                | 1.8                                  | 19.5                      | 77.8                           | 64.8                               |
| 6. Cocktail lounge          | 2.1                                  | 20.7                      | 100.4                          | 79.8                               |
| 7. Candy and ice cream shop | 1.2                                  | 7.7                       | 45.2                           | 38.6                               |
| <b>Hard Goods</b>           |                                      |                           |                                |                                    |
| 8. Hardware store           | 2.4                                  | 19.4                      | 80.2                           | 66.8                               |

| 13. Camera store            | 1.4                                  | 11.3                      | 50.4                           | 42.0                               |
| 14. Toys                    | 2.0                                  | 16.0                      | 73.6                           | 63.7                               |
| 15. Beauty parlor           | 1.0                                  | 9.6                       | 71.2                           | 40.0                               |

Let's define the following decision variables:

$X_i = 1$  if store  $i$  is selected; 0, otherwise ( $i = 1, \dots, 15$ ).

(a). The goal is to maximize the total NPV of all store selection. Formulate the objective function (goal). (2 points)

Maximize

$$38.1X_1 + 44.6X_2 + 60X_3 + 162X_4 + 77.8X_5 + 100.4X_6 + 45.2X_7 + 80.2X_8 + 51.4X_9 + 62.5X_{10} \\ + 18X_{11} + 11.6X_{12} + 50.4X_{13} + 73.6X_{14} + 71.2X_{15}$$

(b). Formulate the constraints for space limit, rent requirement, and construction fund limit. Name and label each constraint. (6 points)

subject to the space constraint

$$\begin{aligned} 1.0X_1 + 1.6X_2 + 2.0X_3 + 3.2X_4 + 1.8X_5 + 2.1X_6 \\ + 1.2X_7 + 2.4X_8 + 1.6X_9 + 2.0X_{10} + 0.6X_{11} \\ + 0.5X_{12} + 1.4X_{13} + 2.0X_{14} + 1.0X_{15} \leq 18 \end{aligned}$$

the annual rent constraint

$$\begin{aligned} 4.4X_1 + 6.1X_2 + 8.3X_3 + 24.0X_4 + 19.5X_5 + 20.7X_6 \\ + 7.7X_7 + 19.4X_8 + 11.7X_9 + 15.2X_{10} + 3.9X_{11} \\ + 3.2X_{12} + 11.3X_{13} + 16.0X_{14} + 9.6X_{15} \geq 150 \end{aligned}$$

the construction cost constraint

$$\begin{aligned} 24.6X_1 + 32.0X_2 + 41.4X_3 + 124.4X_4 + 64.8X_5 \\ + 79.8X_6 + 38.6X_7 + 66.8X_8 + 45.1X_9 + 54.3X_{10} \\ + 15.0X_{11} + 13.4X_{12} + 42.0X_{13} + 63.7X_{14} \\ + 40.0X_{15} \leq 800 \end{aligned}$$

(c). Formulate the requirements from Jane in the last paragraph? Name and label each constraint. (6 points)

at least one clothing store

$$X_1 + X_2 + X_3 \geq 1$$

at least one hard goods store

$$X_8 + X_9 + X_{10} \geq 1$$

at least one miscellaneous-type store

$$X_{11} + X_{12} + X_{13} + X_{14} + X_{15} \geq 1$$

at least two restaurants

$$X_4 + X_5 + X_6 + X_7 \geq 2$$

no more than two clothing stores

$$X_1 + X_2 + X_3 \leq 2$$

miscellaneous types cannot exceed total of clothing and hard goods

$$\begin{aligned} X_1 + X_2 + X_3 + X_8 + X_9 + X_{10} - X_{11} - X_{12} - X_{13} \\ - X_{14} - X_{15} \geq 0 \end{aligned}$$
